

Laser Care instructions

- Lasers allow us to remove soft tissue so that we can bond brackets or reveal more of the crown of a tooth.
- This procedure can help us move your treatment along faster!
- You may be sore for 2-3 days after the procedure. That is normal and over the counter pain medications (Tylenol, Advil, etc.) can help with the soreness.
- There may be redness and irritated tissues around the exposure. Brush the area **gently** with your toothbrush. Warm saltwater rinses may also be soothing.
- If you have any questions or concerns, please give us a call at **419-882-6970**.
